The story of the discovery of a gold mine of astounding riches in China is sup ported by many specifications. The gold-bearing quarts is reported to be on a peninsula across the Corean Sea from the Peninsula of Corea, and directly west. The mountains are very precipitous, and the outcroppings of rocks rich in gold have been traced for sixty miles.

A new York shoomaker suggests that if men would adopt the English fashion of keeping boots on trees they would get ten times as much wear out of them. When the shoes are taken off they should be put on a tree at once. The leather is stretched to its full extent then, and all the wrinkles smoothed away. There is no chance for the leather to crack, as it does if the leather is allowed to remain in one condition long.

Railroad men employed by the Pennsylvania company, like all others, are more or less superstitious. Their superstition rules in numbers, and for years 1,313 has always been regarded as an unlucky number, no matter in what particular it was used. Many cars bearing these figures have been wrecked at divors times, and when a locomotive was constructed and numbered 1,313 there were not a few who predicticted an unfortunate career.

An English sparrow became entangled in a network of electric and telegraph wires in one of the busiest streets of Cincinnati the other day, and was killed, but hung to the wires. Immediately sparrows began to arrive from all sections of the city, and they covered the roofs like a huge blanket. There were thousands upon thousands of They filled the air over the spot, and their noise completely drowned the noise of the street. They remained in the locality for nearly three hours.

If the sun were to stand still as is re corded in the book of Joshua, there would be a wreck of matter and a crash of worlds. But it is not now generally believed that the sun actually stood still. It was thought by Maimonides, a great Jewish theologian, that the passage means that Joshua prayed that he might defeat his enemies before sunset and that he did so. This rendering is accepted by many writers. Others think that there was an eclipse on that day and this is what

ONE ENJOYS

Both the method and results when Syrup of Figs is taken; it is pleasant and refreshing to the taste, and acta gently yet promptly on the Kidneys, Liver and Bowels, cleanses the system effectually, dispels colds, headaches and fevers and cures habitual constipation. Syrup of Figs is the only remedy of its kind ever produced, pleasing to the taste and acceptable to the stomach, prompt in its action and truly beneficial in its effects, prepared only from the most healthy and agreeable substances, its many excellent qualities commend it to all and have made it the most popular remedy known.

Syrup of Figs is for sale in 50c and \$1 bottles by all leading druggists. Any reliable druggist who may not have it on hand will procure it promptly for any one who wishes to try it. Do not accept any substitute.

WASHWOMEN OF MADRID. Ten Thousand Who Daily Ply Their Trade on the Banks of the Manzanares.

Madrid's river of high-sounding name, the Mazanares, is a spatter of wet from the Guadarrama Mountains in winter, a muddy torrent in spring, a sand-blown ditch in the summer, and hardly a capable sewer at any time of the year. It comes down from the cold gray heights to the north of Madrid. and winds half way around the city from the northwest to the southeast What water flows through it breaks in sandy shallows, forming innumerable little islands and curiously bounded strips of land all accessible by any bare-

foot boy or girl. Ten thousand women sonk and splash and souse and beat the linen of Madrid within its scant waters every day. Not an article of clothing is elsewhere washed. No other than these Mazanares lavanderas are permitted to labor as laundresses; and for three miles up and down the stream, from opposite the infantry and artillery barracks, upon the heights of Montana del Principe, past the windows of the Queen Regent's apartments in the royal palace, and circling around away beyond Toledo Gate, the moving dots of red and blue, yellow and gray, comprise this great army of Amazons, with arms and legs on them like tree trunks; with voluptuous breasts and shapely necks; hard-muscled and bronzed as Turks; the most arduous toilers, the wickedest blackguards, and withal the sunniest tempered souls in Spain.

There are three grades in this labor. They are the mistresses, or amns, the overseers or ayudantas, and the lavanderas themselves. All are women. The first are the agents who receive the work from the hotels, great houses, and the city agencies, in huge lots, and are responsible for its safe return. The ayudantas or overseers are really the forewomen of from a dozen to a score of lavanderas each; and they are re-sponsible for work placed in their hands by the amas. At 5 in the morning winter and summer, the lavanderas will be seen, many of them with children trundling beside them, creeping along from the barrios abajos or lower quarters of the city toward the Mauzanares. Near the river is an asilo or asylum, a refuge for their children.

By 6 o'clock you might count from 5,000 to 8,000 of the strange creatures at work. The entire sloping, sandy banks are covered with drying poles At this time of the year the water from the mountains is of icy temperature. But it seems to make no difference with their labors. Here and there huge cauldrons contain boiling water. From time to time a trifle of this is poured in the little hollow where each one toils in the sand and water; but this seems to be done more from habit than necessity. Each lavendera brings her own huge roll of bread, perhaps a bit of cheese, a claspknife to prevent undue liberties from the straggling soldiery near as well as to use in cutting bread, and, just before noon, they breakfast in huge wooden sheds on sait fish, potatoes, and coffee, with a measure of red wine provided by the ama, duplicat-ing this meal at a dinner at 4 in the

They eat like animals, and the moment their food is disposed of the tinkle of the guitar is heard, and you or any kindly disposed passer may dance with them as I did, until the thirty minutes allowed them for food and refresco have expired. On these occasions every one dances, girls of 18 and women of 80, and the scenes along the Manzanares are very picturesque and interesting. But when I tell you that one of these iron-framed wenches must wash dry ready for the "starching, which is done by the criadas in the city, pieces of linen equalling the cleans-ing of seventy sheets, in order to earn 25 cents per day, the poetical sense in it all is with the interested onlooker rather than with the drudging lavanderas of the Manzonares .- Pittsburg Dispatch.

The Color of Water.

What is the color of pure water? Almost any person who has no special knowledge of the subject will reply at once "It has no color." Yet every-body knows, either through hearsay or by evidence of his own eyes, that the ocean looks blue. Why the ocean looks blue is a question that few who have crossed it have ever sought to solve, says Nature, and there are probable many travelers who, though they have seen most of the famous rivers and lakes in the world, have failed to notice the remarkable difference in color which their waters pre-sent. Even the ocean is not uniform in color; in some places its waters are green, or even yellowish. Some lakes are distinctly blue; others present various shades of green, so that in cases they are hardly distinguishable from their level, grass-covered banks; a few are almost black. The lake of Geneva is azure-hued; the lake of Constance and the lake of Lucerne are green; the color of the Mediterranean has been called indigo. The lake of Brienz is greenish yellow, and its neighbor, Lake Thun, is blue. New York has both green and blue lakes. The colors of rivers differ yet more widely. The Rhone is blue, and so is the Danube, while the Rhine is green.

Anybody who has traversed the derful Adirondack region and fished in its waters must have noticed the remarkable difference in the color of its rivers and smaller streams which radiate in every direction from the central group of mountains. The waters of the Sacondaga are yellowish, while those of the Canada creeks and of the Mohawk are clear, with perhaps a bluish tint in deep poles. Fish creek is black or deep brown; and its neighbor, Salmon river, is colorless. Next comes the Black river, whose color is indicated by its name, but between it and the Grasse, which is also black or brown, is the Oswegatchie, with clear, white waters. The St. Regis, again, is black, but the Raquette is white. The St. Lawrence is blue. These various hues are not caused by mud or any apaque sediment, such as that which makes the Mississippi coffee-colored,

but belong to the waters, like the golden color of tea, without greatly impairing their transparency.

The cause of the difference in the color of lakes and rivers has engaged

the attention of many celebrated investigators of nature, such as Tyndall, Bunsen, Arago, Sainte-Claire Doville, and others. Recently Prof. Spring of the University of Liege has carefully investigated the question of the color of water, and has reached some interesting conclusions. According to him, absolute pure water, when seen in masses of sufficient thickness, is blue, and all the varieties of color exhibited in lakes and streams arise from the presence in the water of mineral salts of different degress of solubility and in varying quantities. Water containing carbonate of lime in a state of almost complete solution remains blue, but if solution is less complete the water will have a tinge of green, which will grow stronger as the point of precipi-tation is approached. Prof. Spring concludes that if lime is added to blue water ir which so much carbonate of lime is already dissolved that the point of saturatian is approached the water will become green. In proof of this he cites the fact that the water near the shores of lakes and seas, where it comes in contact with limestone, is a life of wild adventure in all parts of the generally of a greener hue than else-

"SLOYD." A System of Manual Training Now Being Taught in This Country.

The word "sloyd" has been seen in print more or less of late years in magazines as well as newspapers, says the Boston Transcript, and always in connection with the vital question of manual training and its introduction into the public schools. It is an anglicized form of the Swedish slojd, meaning dexterity or manual skill (compare Norse word slogd, cunning; English sly.) Of late, however, the word has been restricted in its use to denote a system of manual training, of which the best known is the socalled Naas system, adopted some

tifteen years ago in Sweden. When this system was adopted at Naas it was new only as a whole. The details had been worked out and proved to be beneficial by different persons at different times and in different countries, but not until then had they been collected and made into a systematic whole. The material used is wood, found, by experiment, to be the cleanest and casiest to work—a most profitable selection, as with proper tools it can be worked into any shape and form.

The purpose of the sloyd instruction is by no means only to give general skill to the hand, but also to stimulate and broaden the mind and to excite love and respect for all honest work; it is to be looked upon as educational, a thing which will help us all and gener ations to come to be more fully and evenly developed.

On the value of the various systems there is much dissent; but all believers in manual training agree to the following principles. The work must, 1. Interest the pupil. 2. Give usesul articles as a product. 3. Promote general dexterity. 4. Develop the sense and love of order and exactness. 5. Encourage cleanliness and neatness, 6. Take into consideration the ability and strength of the pupil. 7. Cultivate the esthetic sense. 8. Develop and strengthen the body. 9. Counteract sedentary occupations. 10. Progress methodically. 11. Train the perception and develop the constructive and inventive faculties, 12. Cultivate attention, diligence, and perseverance. These qualities the sloyd will be found to supply more fully than any other system, while it is better calculated to secure a symmetrical development of mind and body.

Asbestus Mining in Canada.

Mining is carried on by cutting down the hills of asbestus-bearing serpentine, much as a farmer cuts down a stack of hay or straw, or by open quarrying on the level. The rock is blasted out, and the asbestus, separated from the containing rock, is "cobbed"—i. e.: separated by hammering from adhering foreign matter. This "cobbing is a comparatively easy matter in the case of the finer quality, as it usually separates readily from the gangue, but in the lower grades much difficulty is experienced in separating the fibrous matter from the non-fibrous. At best there is great waste. Much of the asbestus is in thin or narrow veins, and is wasted, as by the present mode of operating it does not pay to separate this from the serpentine. A machine that will enable these narrow veins to be utilized is a desideratum.

When "cobbed," the asbestus is graded according to purity, color, and length of fiber into three grades and bagged for shipment. The finest quality of "firsts" finds ready sale at prices ranging from \$80 to \$110 per ton; "seconds" fetch from \$50 to \$70 per ton; while "thirds" may be valued \$13 to \$15 per ton. In good mines the yield of asbestus is from 3 to 5 per cent of the rock quarried, and the cost of mining may be put down at \$25 to \$30 per ton. Returns obtained by the Geological Survey of Canada show that for the year 1888 Canada's output was 3,404 tons valued at the mines at \$225,-000, and the output of nine different Over three-fourths of mines. whole output was shipped to the United States; small quantities going to Great Britain, Germany, France, Belgium, and Italy, and being used in domestic manufacturing. Popular Science Month-

Tennyson Flogged at School.

More Tennysoniana, referring this time to the laureate's school days, "My uncle," writes a correspondent, "though four years the poet's senior, was in the same class with him at Louth, and he used to threaten Alfred Tennyson with a thrashing when he did his Latin verse for him; thus early did he begin to be a poet! To this day he and my father often talk of the tremendous thrashings that 'old Waite.' the headmaster, used to give them for such a small matter as false quantity. I believe both my uncle and Tennyson thrashing. Old Waite's portrait haugs in my father's study now, and only a few years ago, shortly before Mr. Waite's death, my uncle went to see him, then a very old man, and he expressed his regret at having been so cruelly free with the stick; and, if I mistake not, he alluded with pride to Tennyson's fame."—Pall Mall Garette.
